

Strange Quark Matter in Stars: A General Overview

VIIIth International Conference on Strangeness in Quark Matter

Cape Town, South Africa, September 15–20, 2004

Jürgen Schaffner–Bielich

Institut für Theoretische Physik/Astrophysik

J. W. Goethe Universität

Frankfurt am Main

Phase Diagram of QCD

- Early universe at zero density and high temperature
- neutron star matter at zero temperature and high density
- lattice gauge simulations at $\mu = 0$:
phase transition at $T_c \approx 170$ MeV

Neutron Stars

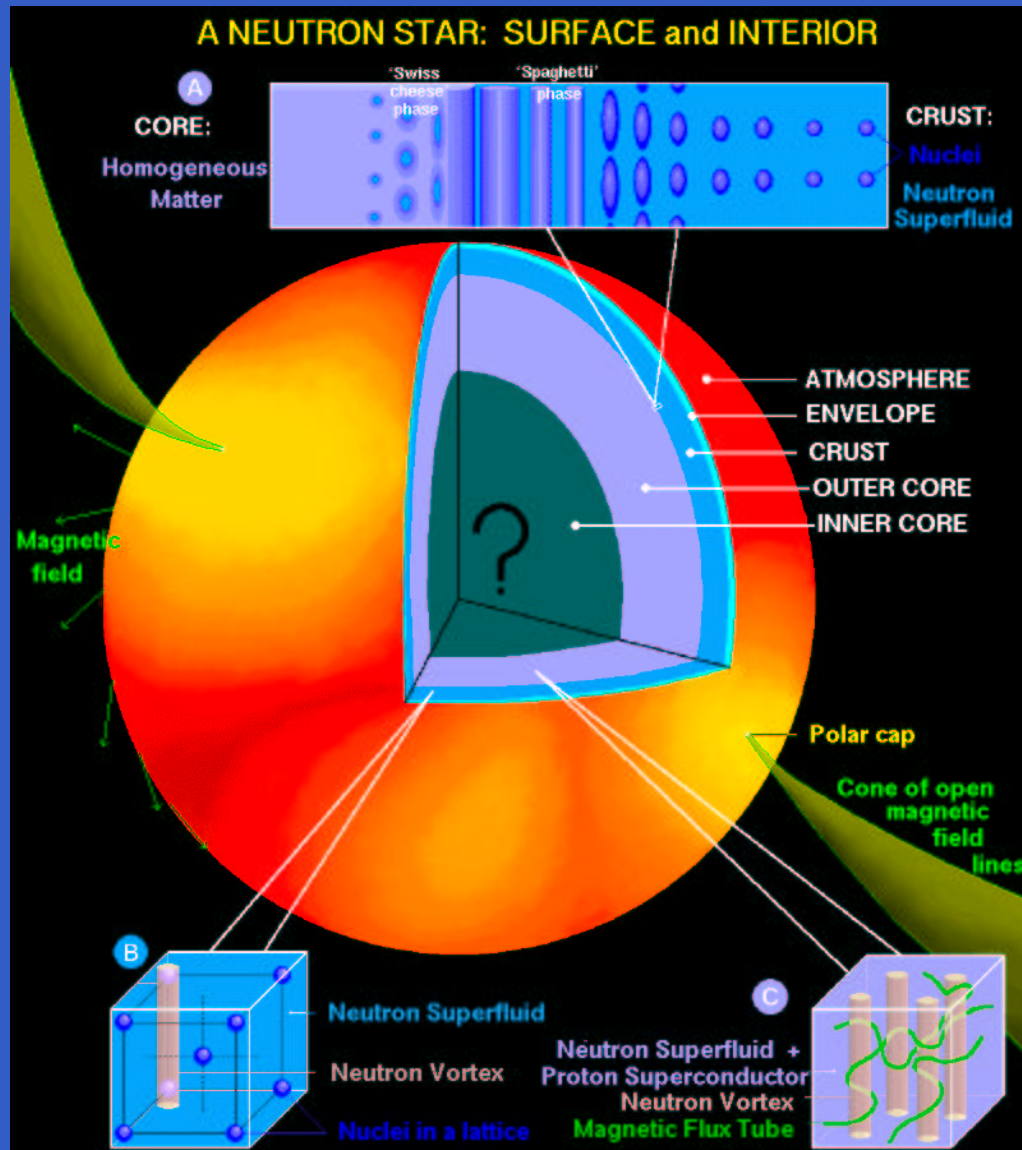

- produced in supernova explosions (type II)
- compact, massive objects: radius ≈ 10 km, mass $1 - 2M_{\odot}$
- extreme densities, several times nuclear density: $n \gg n_0 = 3 \cdot 10^{14} \text{ g/cm}^3$

Masses of Pulsars (Thorsett and Chakrabarty (1999))

- more than 1500 pulsars known
- best determined mass:
 $M = (1.4411 \pm 0.00035)M_{\odot}$
(Hulse-Taylor-Pulsar)
- shortest rotation period:
1.557 ms (PSR 1937+21)

Structure of Neutron Stars — the Crust (Dany Page)

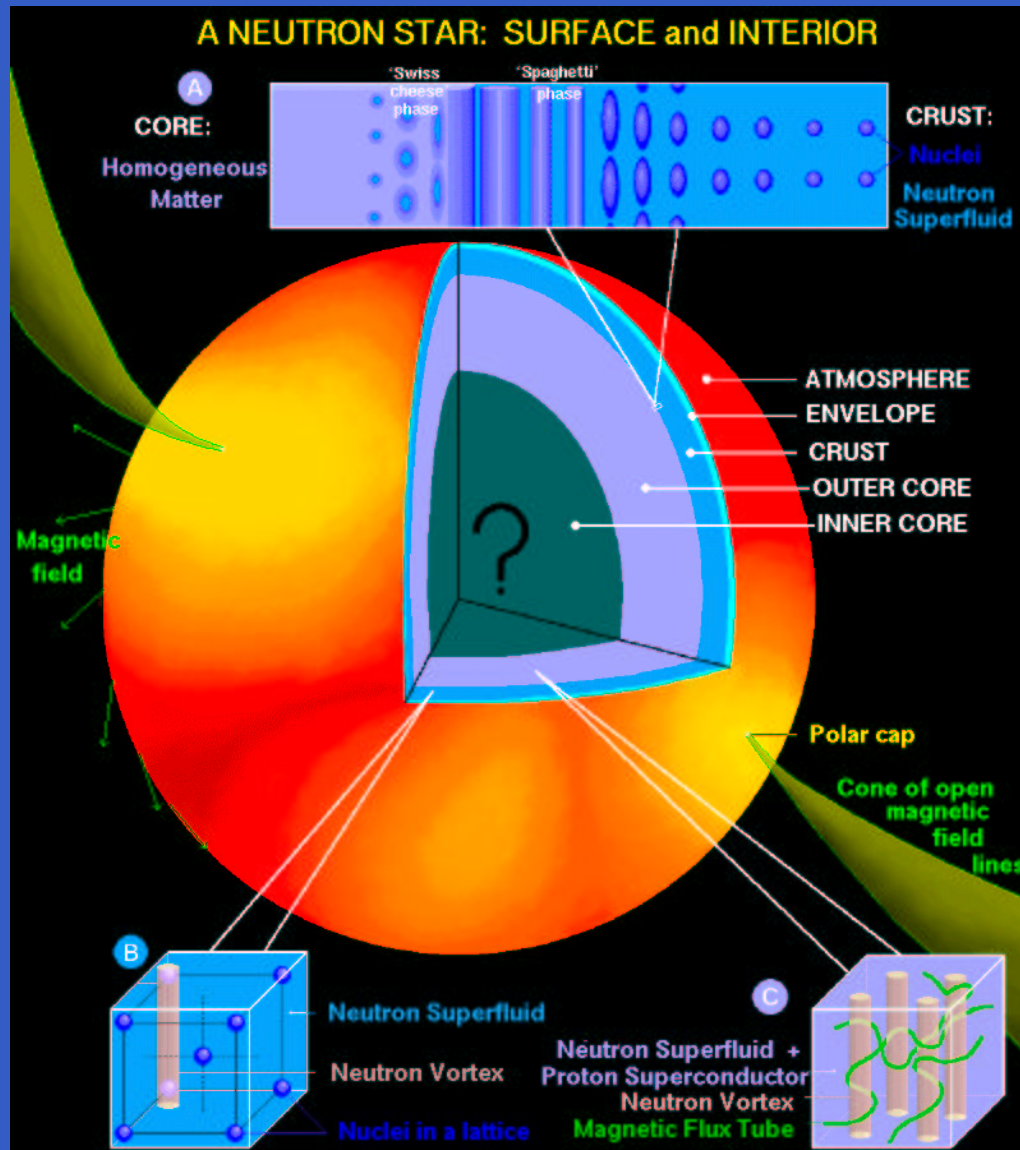

- $n \leq 10^4 \text{ g/cm}^3$:
atmosphere
(atoms)

Structure of Neutron Stars — the Crust (Dany Page)

- $n \leq 10^4 \text{ g/cm}^3$:
atmosphere
(atoms)
- $n = 10^4 - 4 \cdot 10^{11} \text{ g/cm}^3$:
outer crust or envelope
(free e^- , lattice of nuclei)

Structure of Neutron Stars — the Crust (Dany Page)

- $n \leq 10^4 \text{ g/cm}^3$: atmosphere (atoms)
- $n = 10^4 - 4 \cdot 10^{11} \text{ g/cm}^3$: outer crust or envelope (free e^- , lattice of nuclei)
- $n = 4 \cdot 10^{11} - 10^{14} \text{ g/cm}^3$: Inner crust (lattice of nuclei with free neutrons and e^-)

Structure of a Neutron Star — the Core

Neutron Star Matter for a Free Gas

(Ambartsumyan and Saakyan, 1960)

Hadron	p,n	Σ^-	Λ	others
appears at:	$\ll n_0$	$4n_0$	$8n_0$	$> 20n_0$

but the corresponding equation of state results in a maximum mass of only

$$M_{\max} \approx 0.7M_{\odot} < 1.44M_{\odot}$$

(Oppenheimer and Volkoff, 1939)

⇒ effects from strong interactions are essential to describe neutron stars!

Neutron Star Modelling

Neutron Star Matter and Hyperons

Hyperons appear at $n \approx 2n_0$!
(based on hypernuclear data!)

- nonrelativistic potential model (Balberg and Gal, 1997)
- quark-meson coupling model (Pal et al., 1999)
- relativistic mean-field models (Glendenning, 1985; Knorren, Prakash, Ellis, 1995; JS and Mishustin, 1996)
- relativistic Hartree-Fock (Huber, Weber, Weigel, Schaab, 1998)
- Brueckner-Hartree-Fock (Baldo, Burgio, Schulze, 2000; Vidana et al., 2000)
- chiral effective Lagrangian's (Hanauske et al., 2000)
- density-dependent hadron field theory (Hofmann, Keil, Lenske, 2001)

⇒ neutron stars are strange !!!

Ultracompact Neutron Stars with Hyperons — Hyperon Stars

(JSB, Hanauske, Stöcker, Greiner, PRL 89, 171101 (2002))

- new stable solution in the mass–radius diagram!
- neutron star twins:
 $M_{\text{hyp}} \sim M_n$ but
 $R_{\text{hyp}} < R_n$
- selfbound compact stars for strong attraction with
 $R = 7 - 8$ km

Selfbound Star versus Neutron Star

selfbound stars:

- vanishing pressure at a finite energy density
- mass-radius relation starts at the origin (ignoring a possible crust)
- arbitrarily small masses and radii possible

neutron stars:

- bound by gravity, finite pressure for all energy density
- mass-radius relation starts at large radii
- minimum neutron star mass:
 $M \sim 0.1 M_\odot$ with $R \sim 200$ km

Selfbound Star versus Neutron Star

(Hartle, Sawyer, Scalapino (1975!))

selfbound stars:

- vanishing pressure at a finite energy density
- mass-radius relation starts at the origin (ignoring a possible crust)
- arbitrarily small masses and radii possible

neutron stars:

- bound by gravity, finite pressure for all energy density
- mass-radius relation starts at large radii
- minimum neutron star mass:
 $M \sim 0.1 M_\odot$ with $R \sim 200$ km

Signals for Strange Stars?

similar masses and radii, cooling, surface (crust), ... but look for

- extremely small mass, small radius stars (includes strangelets!)

Signals for Strange Stars?

similar masses and radii, cooling, surface (crust), ... but look for

- extremely small mass, small radius stars (includes strangelets!)
- strange dwarfs: small and light white dwarfs with a strange star core (Glendenning, Kettner, Weber, 1995)

Signals for Strange Stars?

similar masses and radii, cooling, surface (crust), ... but look for

- extremely small mass, small radius stars (includes strangelets!)
- strange dwarfs: small and light white dwarfs with a strange star core (Glendenning, Kettner, Weber, 1995)
- super-Eddington luminosity from bare, hot strange stars (Page and Usov, 2002)

Signals for Strange Stars?

similar masses and radii, cooling, surface (crust), ... but look for

- extremely small mass, small radius stars (includes strangelets!)
- strange dwarfs: small and light white dwarfs with a strange star core (Glendenning, Kettner, Weber, 1995)
- super-Eddington luminosity from bare, hot strange stars (Page and Usov, 2002)
- conversion of neutron stars to strange stars (explosive events!)

Signals for Strange Stars?

similar masses and radii, cooling, surface (crust), ... but look for

- extremely small mass, small radius stars (includes strangelets!)
- strange dwarfs: small and light white dwarfs with a strange star core (Glendenning, Kettner, Weber, 1995)
- super-Eddington luminosity from bare, hot strange stars (Page and Usov, 2002)
- conversion of neutron stars to strange stars (explosive events!)
- ...

Third Family of Compact Stars

(Schertler, Greiner, JSB, Thoma (2000))

- third solution to the TOV equations besides white dwarfs and neutron stars, solution is stable!
- generates stars more compact than neutron stars
- possible for any first order phase transition!

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)
- delayed collapse of a proto-neutron star to a black hole (Thorsson, Prakash, Lattimer, 1994)

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)
- delayed collapse of a proto-neutron star to a black hole (Thorsson, Prakash, Lattimer, 1994)
- collapse of a neutron star to the third family? (gravitational waves, γ -rays, neutrinos)

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)
- delayed collapse of a proto-neutron star to a black hole (Thorsson, Prakash, Lattimer, 1994)
- collapse of a neutron star to the third family? (gravitational waves, γ -rays, neutrinos)
- secondary shock wave in supernova explosions?

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)
- delayed collapse of a proto-neutron star to a black hole (Thorsson, Prakash, Lattimer, 1994)
- collapse of a neutron star to the third family? (gravitational waves, γ -rays, neutrinos)
- secondary shock wave in supernova explosions?
- gravitational waves from colliding neutron stars?

Signals for a Third Family/Phase Transition?

- mass-radius relation: rising twins (Schertler et al., 2000)
- spontaneous spin-up of pulsars (Glendenning, Pei, Weber, 1997)
- delayed collapse of a proto-neutron star to a black hole (Thorsson, Prakash, Lattimer, 1994)
- collapse of a neutron star to the third family? (gravitational waves, γ -rays, neutrinos)
- secondary shock wave in supernova explosions?
- gravitational waves from colliding neutron stars?
- . . .

The Third Family: Quark Stars, Hyperon Stars ...

- MIT bag model (Glendenning and Kettner, 2000)
- massive quasi-particles of quarks (Schertler, C. Greiner, JSB, Thoma, 2000)
- interacting quarks in pQCD (Fraga, JSB, Pisarski, 2001)
- Kaon condensate (Banik and Bandyopadhyay, 2001)
- Hyperon Matter (JSB, Hanauske, Stöcker, W. Greiner, 2002)
- MIT bag model (Mishustin, Hanauske, Bhattacharyya, Satarov, Stöcker, W. Greiner, 2003)
- color-superconducting quarks (Banik and Bandyopadhyay, 2003)
- MIT bag and rotation (Bhattacharyya, Ghosh, Hanauske, Raha, 2004)
- Kaon condensate, quarks and rotation (Banik, Hanauske, Bandyopadhyay, W. Greiner, 2004)

A Model For Cold And Dense QCD

Two possibilities for first-order chiral phase transition:

- A weakly first-order chiral transition (or no true phase transition),
 \implies one type of compact star (neutron star)
- A strongly first-order chiral transition
 \implies two types of compact stars:
a new stable solution with smaller masses and radii

The two possible scenarios

- **Weak:** phase transition is weakly first order or a crossover \rightarrow pressure in massive phase rises strongly
- **Strong:** transition is strongly first order \rightarrow pressure rises slowly with μ
- asymmetric matter up to $\sim 2n_0$: [Akmal,Pandharipande,Ravenhall (1998)]

$$E/A \sim 15 \text{ MeV} (n/n_0) \rightarrow p_B \sim 0.04 \left(\frac{n}{n_0} \right)^2 \left(\frac{m_q}{\mu} \right)^4 \cdot p_{\text{free}}$$

Quark star twins? (Fraga, JSB, Pisarski (2001))

blue curves: pQCD calculation

- **Weak transition:** ordinary neutron star with quark core (hybrid star)
- **Strong transition:** third class of compact stars possible with maximum masses $M \sim 1 M_{\odot}$ and radii $R \sim 6$ km
- Quark phase dominates ($n \sim 15 n_0$ at the center), small hadronic mantle

Massive Quark Stars? (Rüster and Rischke (2004))

- quark star with color–superconducting quarks
- uses NJL model for pairing quarks
- increased interactions gives massive quark stars
- massive quark stars also for HDL calculation (Strickland and Andersen (2002))

Phases in Strange Quark Matter (Rüster, Shovkovy, Rischke (2004))

- phases of color superconducting quark matter in β equilibrium
- two-flavor color superconducting phase (2SC), gapless 2SC phase, only up quarks pair (uSC)
- color-flavor locked phase (CFL), gapless CFL phase, metallic CFL phase
- normal (unpaired) quark matter (NQ) only at large temperatures
- important for newly born, hot proto-neutron stars!

Neutron Star Data

Constraints on the Mass–Radius Relation

(Lattimer and Prakash (2004))

- spin rate from PSR B1937+21 of 641 Hz: $R < 15.5$ km for $M = 1.4M_{\odot}$
- observed giant glitch from Vela pulsar: moment of inertia changes by 1.4
- Schwarzschild limit (GR): $R > 2GM = R_s$
- causality limit for EoS: $R > 3GM$

Heavy Neutron Stars in Pulsar–White Dwarfs Systems?

(Nice, Splaver, Stairs (2003))

- four pulsars with a white dwarf companion
- measure masses by changes in the pulsar signal
- shaded area: from theoretical limits for white–dwarf companion
- massive pulsar
J0751+1807:
 $M = 1.6 - 2.8 M_{\odot}$ (2σ !)
- independent of the inclination angle!

Isolated Neutron Star RX J1856

(Drake et al. (2002))

- closest known neutron star
- perfect black-body spectrum, no spectral lines!
- for black-body emission: $T = 60 \text{ eV}$ and $R_\infty = R\sqrt{1 - 2GM/R} = 4 - 8 \text{ km!}$

Modeling the Atmosphere of Neutron Stars (Burwitz et al. (2003))

- H atmospheres ruled out, they over-predict the optical flux!
- heavy element atmospheres ruled out, as there are no spectral lines!
- all classic neutron star atmosphere models fail!
- alternatives: two-component blackbody model (left plot)
- or condensed matter surface for low $T < 86 \text{ eV}$ and high $B > 10^{13} \text{ G}$ (right plot) — greybody with a suppression of a factor 7!

RXJ 1856: Neutron Star or Quark Star? (Trümper et al. (2003))

- two-component blackbody: small soft temperature, so as not to spoil the x-ray band
- this implies a rather LARGE radius so that the optical flux is right!
- conservative lower limit: $R_{\infty} = 16.5$ km ($d/117$ pc)
- excludes quark stars and even neutron stars with a quark core!?

Spectra from Geminga (Caraveo et al. (2004))

- three component fit to spectra of the Geminga pulsar:

Spectra from Geminga (Caraveo et al. (2004))

- three component fit to spectra of the Geminga pulsar:
- power law tail at high energies (from magnetosphere)

Spectra from Geminga (Caraveo et al. (2004))

- three component fit to spectra of the Geminga pulsar:
- power law tail at high energies (from magnetosphere)
- hot black-body with a size of only $R = 40 \pm 10$ m (from polar caps)

Spectra from Geminga (Caraveo et al. (2004))

- three component fit to spectra of the Geminga pulsar:
- power law tail at high energies (from magnetosphere)
- hot black-body with a size of only $R = 40 \pm 10$ m (from polar caps)
- cool black-body with a size of $R = 8.6 \pm 1$ km (from pulsar surface?)

Phase Resolved Spectra from Geminga (Caraveo et al. (2004))

← power law flux at 1 keV

- power law tail at high energies (from magnetosphere)

Phase Resolved Spectra from Geminga (Caraveo et al. (2004))

← radius of $T = 170$ eV hot spot
(hot black-body)

← power law flux at 1 keV

- power law tail at high energies (from magnetosphere)
- hot black-body with a size of only $R = 60$ m (from polar caps)

Phase Resolved Spectra from Geminga (Caraveo et al. (2004))

← radius of $T = 43$ eV emitting area
(cool black-body)

← radius of $T = 170$ eV hot spot
(hot black-body)

← power law flux at 1 keV

- power law tail at high energies (from magnetosphere)
- hot black-body with a size of only $R = 60$ m (from polar caps)
- cool black-body with a size of $R = 10$ km (from hot continent)

Phase Resolved Spectra from Geminga (Caraveo et al. (2004))

- ← radius of $T = 43$ eV emitting area (cool black-body)
- ← radius of $T = 170$ eV hot spot (hot black-body)
- ← power law flux at 1 keV

- power law tail at high energies (from magnetosphere)
- hot black-body with a size of only $R = 60$ m (from polar caps)
- cool black-body with a size of $R = 10$ km (from hot continent)
- varies with time, not from entire surface!

X-Ray burster

- binary systems of a neutron star with an ordinary star
- accreting material on the neutron star ignites nuclear burning
- explosion on the surface of the neutron star: x-ray burst
- red shifted spectral lines measured!
 $(z = 0.35 \rightarrow M/M_{\odot} = 1.5 \text{ (R/10 km)})$
 (Cottam, Paerels, Mendez (2002))

Future Probes Using X-Ray Bursts

(Strohmayer (2004))

- X-ray bursts from accreting neutron stars originating from the surface
- measure profile of emitted spectral lines
- spectral profile is modified from space-time warpage
- → gives a model independent mass and radius!

Neutron Stars in Globular Cluster (Rutledge et al. (2002))

- X-ray observations with the Chandra satellite of globular cluster (NGC5139)
- spectra fitted with H atmosphere
- most sources show a hot spot from accretion (extremely small radii)
- quiescent neutron stars found (qNSs): thermal emission from whole surface measurable
- allows to constrain the EoS:
 $R_{\infty} = 14.3 \pm 2.5$ km

Central Compact Objects (CCOs) in Supernova Remnants

(Pavlov, Sanwal, Teter (2003))

- CCOs: point-like sources in the center of supernova remnants
- only observed in x-rays, radio-quiet, no pulsations seen
- temperatures of 0.2–0.5 keV and sizes of only 0.3–3 km!?!

Cooling of Supernova Remnants (Kaplan et al. (2004))

- known age of the neutron star constrains cooling curves
- newest data from four neutron stars suggest fast cooling
- standard cooling curves are too high!
- signature for exotic matter in the core?

Pulsar Distribution in our Galaxy

- distance estimate by dispersion measure (DM)
- dispersion due to conducting interstellar medium
- works for known electron number density distribution

Future: Square Kilometer Array (SKA)

- receiving surface of 1 million square kilometers
- 1 billion dollar international project
- potential to discover:
 - ◆ 10,000 to 20,000 new pulsars
 - ◆ more than 1,000 millisecond pulsars
 - ◆ at least 100 compact relativistic binaries!
- probing the equation of state at extreme limits!
- cosmic gravitational wave detector by using pulsars as clocks!
- design and location not fixed yet, maybe it will be in South Africa!

Summary

- low density part more or less known up to $\approx n_0$

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter
- hypernuclear data: hyperons present in neutron stars are only Λ s and Ξ s

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter
- hypernuclear data: hyperons present in neutron stars are only Λ s and Ξ s
- first order phase transition to quark matter likely in cold, dense matter

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter
- hypernuclear data: hyperons present in neutron stars are only Λ s and Ξ s
- first order phase transition to quark matter likely in cold, dense matter
- \rightarrow generates a new, stable solution for compact stars! (besides white dwarfs and neutron stars)
 \Rightarrow **small and really dense stars** mainly composed of quark matter

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter
- hypernuclear data: hyperons present in neutron stars are only Λ s and Ξ s
- first order phase transition to quark matter likely in cold, dense matter
- \rightarrow generates a new, stable solution for compact stars! (besides white dwarfs and neutron stars)
 \Rightarrow **small and really dense stars** mainly composed of quark matter
- present data about compact stars is still puzzling and full of surprises

Summary

- low density part more or less known up to $\approx n_0$
- hyperons appear at $n = 2n_0$ in neutron star matter
- hypernuclear data: hyperons present in neutron stars are only Λ s and Ξ s
- first order phase transition to quark matter likely in cold, dense matter
- \rightarrow generates a new, stable solution for compact stars! (besides white dwarfs and neutron stars)
 \Rightarrow **small and really dense stars** mainly composed of quark matter
- present data about compact stars is still puzzling and full of surprises
- but the future is bright for peering into the heart of compact stars!

Historical Notes to the Third Family, Quark Stars and Selfbound Stars

- Kurdgelaidze and Ivanenko 1965: collapse to quark stars
- Gerlach 1968: general considerations for a third family
- Kurdgelaidze and Ivanenko 1969: superconducting quark matter
- Heintzmann 1969, Heintzmann and Hillebrandt 1970: Hyperon Stars (ultradense compact stars)
- Libby and Thomas 1969: Mass-Radius plot of ultradense stars
- Itoh 1970: quark star masses ($M/M_{\odot} \approx 10^{-3}$)
- Heintzmann, Hillebrandt, El Eid, Hilf 1974: Hyperon Stars using Pandharipande's EoS with hyperons
- Hartle, Sawyer, Scalapino 1975: selfbound stars with pion condensation
- Källman 1975, 1976: Abnormal neutron stars (chirally restored matter) and nuggets!

Historical Notes to the Third Family, Quark Stars and Selfbound Stars II

- Brecher and Caporaso 1976: obese quark stars within MIT bag EoS
- Baym and Chin 1976: pure quark star within the MIT bag model (like strange star!)
- Bowers, Gleeson, Pedigo 1977: (unstable) quark stars within scalar-vector field theory
- Fechner and Joss 1978: quark stars besides neutron stars in pQCD!
- Kämpfer 1981, 1983: quark stars and pion-condensed stars as a third stable family
- Haensel, Zdunik, Schaefer; Alcock, Farhi, Olinto, 1986: Strange Stars
- Thorsson et al. 1994: mass-radius plot of a third family for kaon condensed star
- Fujii et al. 1996: kaon-condensed star as a new class of compact stars
